Built with Claude Code · specified, reviewed and verified by me

QA ENGINEERING SYSTEM

Test automation	Diagnostic skills	Everyday skills
proof of concept — web / Android / iOS	6 skills	4 skills

WHAT EXISTS, AND WHAT IT IS FOR

Automated smoke suites

WHAT A proof of concept, not a full automation suite: 24 smoke-level checks on Android (17 guest, 7 signed-in) and the same 24 on iOS from an identical scaffold, re-run after the package was restructured; web runs on the same base, though so far it only launches the site. Planned: 24 smoke checks, as on mobile. Scope is deliberately smoke — installation, launch, key screens, network-log verification — but each check watches the server's replies, so a hidden error fails it instead of passing silently. Deeper testing stays manual.

WHY When something breaks, the evidence is already collected — which build, which step, which request.

Six on-demand diagnostic skills

WHAT Six procedures, triggered in plain language, that do the digging and return a draft: owning team and channel, the failing service behind an error, a ticket summary, new store reviews, squad decision history, or a customer's feature flags. A person reviews before anything is sent.

WHY The knowledge stops living in one person's head. A new joiner gets the same shortcuts on day one, and an answer no longer waits for the right colleague to be online.

Four everyday skills

WHAT Four importable skills, one per question, plus ten written guides kept honest by seven automated guards that fail the moment documentation drifts from the code.

WHY Removes recurring overhead from the team without adding anything else that someone has to own.

WHO DID WHAT

AREA	MY CONTRIBUTION	CLAUDE CODE
Test strategy and scope	**Decided by me — what is automated, what stays manual**	—
QA architecture, oracles, safety rules	**Designed by me**	Implemented with Claude Code
Test scenarios and skill workflows	**Written by me — steps, data and expected results**	Translated into code by Claude Code
Automation code and documentation	**Scoped, reviewed and validated by me**	Authored by Claude Code
Verification	**Performed by me**	Stated per item, including what remains unverified, in the full case study

> **Stated plainly:** generated code is not evidence of automation expertise. It is evidence that a QA engineer with a clear specification can produce working tooling. I am only making the second claim, and I do not list Selenium, Playwright or Appium as skills of mine.

HOW IT RUNS

Test environment only, never production. No auto-accept, no skipped permissions: every command confirmed, every output reviewed by a person. The package ships with zero credentials.

> **The full case study** is a 14-slide deck: the QA flow behind each decision, the test-oracle and evidence design, failure diagnosis, a per-item verification status and a retrospective.
